

## C5.1 Combined Science Mastery Quiz: Carbon Chemistry

### Mark Scheme

#### Section A

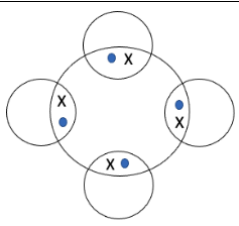

Qu	Answer	Marks	Supporting information for fix-it tasks
1	A	1	<p>Answering B or C suggests that students are unable to identify where crude oil comes from.</p> <p><i>To fix it, review where crude oil is found and where it has come from.</i></p>
2	B	1	<p>Answering A suggests that students have confused crude oil with a single hydrocarbon, which is a common error.</p> <p>Answering C suggests that students are not clear on the definition of a molecule.</p> <p><i>To fix it, review the definitions of compound, mixture and molecule and give students example formulae and mixtures to classify.</i></p>
3	B	1	<p>Answering A or C means students are mixing up the naming of alkanes.</p> <p><i>To fix it, review the general formula for alkanes and the acronym for naming the first four: monkeys eat peanut butter.</i></p>
4	B	1	<p>Answering A shows students have doubled the number of carbons but forgotten the +2.</p> <p>Answering C shows that students have added two before doubling, so have used the incorrect order of operations.</p> <p><i>To fix it, give students lots of practice working out the number of carbons and hydrogens in different alkanes.</i></p>
5	A	1	<p>Answering B or C suggests that students cannot recall that covalent bonding is between non-metals atoms. This is a common error where students struggle to relate large molecules to simple molecules.</p> <p><i>To fix it, review the definition of a covalent bond and the full dot and cross diagrams for the first four alkanes.</i></p>
6	C	1	<p>Answering A shows that students have added the given numbers together.</p> <p>Answering B shows that students have seen the formula of the product is <math>C_nH_{2n}</math> and assumed that both products would have the same general formula.</p>

			<i>To fix it, give students practice determining products from cracking equations.</i>
7	A	1	<p>Answering B suggests that students have confused cracking and fractional distillation.</p> <p>Answering C shows that students are not clear that shorter hydrocarbon chains are more useful/more in demand.</p> <p><i>To fix it, review the uses of short chain and long chain hydrocarbons and get students to explain why there may be higher demand for petrol hydrocarbons rather than kerosene hydrocarbons.</i></p>
8	D	1	<p>Answering A or B show that students have confused the test for saturation with the test for carbon dioxide, which is a common error. Answering B shows that students recognise the colour change is to colourless.</p> <p>Answering C shows that students have recognised that bromine water is used for the test but have confused a positive result with that of a positive test for carbon dioxide.</p> <p><i>To fix it, review the test for saturation and give students examples of compounds (ethane, ethene, propane, propene etc) to determine if they would test positive or negative for saturation.</i></p>
9	C	1	<p>Answering A suggests that the students have just read the stages in order.</p> <p>Answering B shows that students have not understood that the reason that hydrocarbons evaporate is because the crude oil is heated.</p> <p><i>To fix it, review the process of fractional distillation and get students to summarise the steps in their own words.</i></p>
10	A	1	<p>Answering B suggests that students have confused melting and boiling points.</p> <p>Answering C suggests the common misconception that the different hydrocarbons themselves have different temperatures rather than boiling points.</p> <p><i>To fix it, show students a simple model using distillation to show that the whole mixture is heated and the compounds within in boil at different temperatures.</i></p>
11	B	1	<p>Answering A or C suggests that students are mixing up the products with oxygen as a reactant.</p> <p><i>To fix it, review the definition of a combustion reaction and get students to write the general equation for the combustion of alkanes.</i></p>

12	B	1	<p>Answering A shows that students know there is a limiting reactant involved but not identified this as oxygen.</p> <p>Answering C shows that students have not understood that oxygen is in excess for complete combustion reactions.</p> <p><i>To fix it, review the difference between complete and incomplete combustion.</i></p>
13	A	1	<p>Answering B shows that students have recognised combustion as exothermic but not selected the correct definition of an exothermic reaction.</p> <p>Answering C or D suggests that students have not recognised combustion as exothermic, although answering C shows that they have recognised energy is transferred to the surroundings.</p> <p><i>To fix it, remind students of the definitions of exothermic and endothermic reactions and show students a reaction profile for alkane combustion, asking them to explain what it shows.</i></p>
14	B	1	<p>Answering A suggests that students are mixing up alkanes and alkenes and unclear on the naming conventions for polymers.</p> <p>Answering C shows that students have confused the monomer with the homologous group.</p> <p><i>To fix it, ask students to determine the name of the polymer that would be formed from different monomers.</i></p>
15	B	1	<p>Answering A shows that students are not clear on what incomplete combustion means.</p> <p>Answering C shows that students are aware that sulfur is related to general pollution but have not made the link between sulfur and sulfur dioxide.</p> <p><i>To fix it, review the disadvantages of burning hydrocarbons and explain how this is linked to acid rain.</i></p>

## Section B

Qu	Model answer	Indicative marks	Supporting information
----	--------------	------------------	------------------------

			<b>Suggestions for fix-it tasks</b>
1a	<pre>       H   H   H   H                     H — C — C — C — C — H                           H   H   H   H           </pre>	2  Allow 1 for correct number of hydrogen atoms	
1b	C <sub>4</sub> H <sub>10</sub>	1	
2a	Methane: Gas Hexane: Liquid	2	
2b	<ul style="list-style-type: none"> <li>Both are hydrocarbons/contain hydrogen and carbon atoms</li> <li>Methane has 1 carbon atom, hexane has 6</li> <li>Methane has 4 hydrogen atoms, hexane has 14</li> <li>Both contain covalent bonds</li> <li>Methane only contains C-H bonds, hexane also contains C-C bonds</li> <li>Both are small molecules</li> <li>Hexane is a larger molecule than methane</li> <li>Methane is a gas at room temperature whereas hexane is a liquid</li> <li>Hexane has a higher melting point than methane</li> <li>Hexane has a higher boiling point than methane</li> <li>There are weak forces between molecules in both methane and hexane</li> <li>The intermolecular forces between molecules of hexane are stronger than in methane</li> <li>Hexane is more viscous than methane</li> <li>Methane is more flammable than hexane</li> <li>Both produce carbon dioxide and water through combustion</li> </ul>	4	<i>To fix-it, go through each of the suggested points and get students to identify whether they are comparing structure or properties, then repeat the question for two different alkanes.</i>
2c	Boiling point increases as the number of (carbon) atoms increases  <u>Because</u> the intermolecular forces increase	2	
2d		2
